Linear Wood - Linear Wood Dowel Grille

Note: Ceiling shown features a 3/4" (19mm) reveal between Dowel Grille panel groupings.

1. Prior to installation please check and verify that all required components have been received. Using the attached drawings identify all components received.
2. Check and verify the quantities of components received against the quantities required for the project.

Note: All T bar grids utilized for the mounting of Linear Wood Products must be installed to support the loading applied to the structure by the Linear wood components. All main "T's" will be on 2'-0" centers with hanger wires located at no more than 4'-0" spacings. All cross "T's" will be located on 2'-0" centers.

sales@decoustics.com, www.decoustics.com

Step #1 To install Linear wood dowel grille panels onto "T" bar grid, insert the dowel hanger clip onto the dowel support rail.

Step #2 Once the dowel grille clips are located on the support dowel align the grille panel to the "T" bar grid.

Step #3 Raise the dowel grille panel assembly with hanger clips up until the clips engage with the heavy duty "T" bar rail.

Step #4 The Linear wood dowel grille panel is now installed.

Linear Wood - Linear Wood Dowel Grille - Wall Mounting Detail

When wall mounting of Dowel Grille is required the Grille is attached to the wall with the addition of angle bracket hardware. The angle bracket is attached to the Grille blade and the angle is then affixed to the wall with appropriate mounting screws. Utilization of the correct number of angle brackets and type of wall anchors is critical.

Cutting of Linear Wood Product Planks and Blades

When Cutting Linear Plank or Linear Grille Products it is important to use equipment that will not tear or chip the wood veneer components. Traditional woodworking tools are suitable for cutting Linear Wood and Grille Ceilings. Decoustics recommends using large diameter chop saws or radial saws having a carbide tipped blade with a sharp, thin -kerf, 80 tooth - at 10" (254mm) diameter - and alternating 40 degree bevel. Cut products with face up to avoid scratching. Make certain that the cutting tool has adequate depth of cut to pass through the products height.

Note: A traditional table saw would require the plank to be cut much slower to avoid tear-out or chipping. If cutouts are required for round fixtures, Decoustics recommends a router and template method using a quality spiral-down carbideflute cutting bit.

When cutting metal components it is recommended to utilize the appropriate tool such as a metal cut-off saw, hacksaw, or hand grinder with cut-off blade.

Finishing of Cut Ends - Linear Wood Product Planks and Blades

Cutting through Linear Plank or Linear Blade rails will expose the mdf core material. It is recommended to finish the cut ends and in this way to seal the core material. The two recommended ways of finishing cut ends is:

- 1. Spray or brush coat the exposed ends of the Linear wood product with a high quality clear lacquer coating. Such products are available at most hardware or building supply outlets.**
- 2. Pre-finished veneer material with a self adhesive backing is available upon request at additional cost. The pre finished veneer can be cut to the desired size and adhered to the cut ends utilizing the self adhesive backing. Once attached to the Linear wood product the excess material can be trimmed with a knife or sanded flush to the exterior profile of the cut end.**

Note: We recommend that any installations of Linear wood products be done under the supervision of a qualified and experienced individual with a good thorough knowledge of wood working and cabinet building techniques.

Special Services and Client Support

Linear wood products are purchased on the understanding that the materials supplied to our clients are a commodity type product. Decoustics can provide basic customer support related to the installation of Linear wood products.

For installations involving the customization of Linear wood products Decoustics can provide design and fabrication services at additional cost.

Linear Wood - Linear Wood / Cross Piece Grille

1. Prior to installation please check and verify that all required components have been received. Using the attached drawings identify all components received.
2. Check and verify the quantities of components received against the quantities required for the project.

Note: All T bar grids utilized for the mounting of Linear Wood Products must be Installed to support the loading applied to the structure by the Linear wood components. All main "T's" will be on 2'-0" centers with hanger wires located at no more than 4'-0" spacings. All cross "T's" will be located on 2'-0" centers.

To Install Linear Wood Cross Piece Grille panels it is recommended to use black coated Sheet Metal Screws #8 x 1 1/2 " (to be supplied by others)

3. Linear wood Lay-in Lift and Shift Grille panel is positioned under the "T" bar support grid. the support rails on one side of the panel are then inserted into to the heavy duty "T" bar while the opposite side is rotated into the grid opening. The panel is then shifted to the side to seat itself in the grid.

sales@decoustics.com, www.decoustics.com

Step #1 To install Linear Wood Grille Lift and shift panels into "T" bar grid, insert the support cross rails into the "T" bar ceiling grid as shown in the drawing below.

Step #2 Once the cross rails are located inside the "T" bar grid rotate the opposite side of the panel up so that the cross rail supports clear the "T" bar grid.

Step #3 Once the opposite side cross rails are located inside the "T" bar grid slide the panel up and back so that the cross rail supports now are in contact above the "T" bar grid. Allow the panel to drop and seat itself in the "T" bar grid.

Step #4 The Linear wood Grille Lift and Shift panel is now installed in the grid. To remove the panel repeat steps One, two, and three in reverse order.

All lay-in Linear Grille panels require the attachment of a wire Lanyard between the panel and the heavy duty support Grid. Each Lanyard comes with a locking clip.
